1. Distance of the centre of mass of a solid uniform cone its vertex is $z_{0}$. If the radius of its base is $R$ and its height is $h$ then $z_{0}$ is equal to:
(A) $\frac{5 h}{8}$
(B) $\frac{3 h^{2}}{8 R}$
(C) $\frac{h^{2}}{4 R}$
(D) $\frac{3 h}{4}$

Answer: (D)
Solution:

Consider an elementary disc of radius $r$ and thickness dy.

If total mass of cone $=\mathrm{M}$ and density $=\rho$
Then mass of elementary disc is $\mathbf{d m}=\rho \mathbf{d v}=\rho \times \pi r^{2} d y$

In similar $\Delta^{\prime}$ s AOE and $\mathrm{AO}^{\prime} \mathrm{C}$
$\frac{y}{h}=\frac{r}{R} \Rightarrow r=\frac{y}{h} R$

Put (2) in (1)
$d m=\rho(\pi)\left(\frac{y}{\mathrm{~h}} \mathrm{R}\right)^{2} \mathrm{dy}$
$\mathrm{dm}=\rho \times \frac{\pi^{\mathrm{R}^{2}}}{\mathrm{~h}^{2}} y^{2} \mathrm{dy}$
$\therefore$ The centre of mass of cone lying on the line AO ' at a distance $y_{c m}$ from A can be calculated as

$$
\begin{aligned}
& y_{\mathrm{cm}}=\frac{\int(\mathrm{dm}) y}{\int \mathrm{dm}}=\frac{\int \rho \pi \mathrm{R}^{2}}{\mathrm{~h}^{2}} \frac{y^{3} \mathrm{dy}}{\int \mathrm{dm}} \\
& =\frac{\rho \pi \mathrm{R}^{2}}{\mathrm{~h}^{2} \mathrm{M}} \int_{0}^{\mathrm{h}} y^{3} \mathrm{dy} \\
& \because \mathrm{M}=\rho \times \frac{1}{3} \pi \mathrm{R}^{2} \mathrm{~h} \\
& \Rightarrow y_{\mathrm{cm}}=\frac{\rho \pi \mathrm{R}^{2}}{\mathrm{~h}^{2} \rho \times \pi \mathrm{R}^{2} \mathrm{~h}} \times \frac{\mathrm{h}^{4}}{4}=\frac{3 \mathrm{~h}}{4}

(A) $5.48 \mathrm{~V} / \mathrm{m}$
(B) $7.75 \mathrm{~V} / \mathrm{m}$
(C) $1.73 \mathrm{~V} / \mathrm{m}$
$2.45 \mathrm{~V} / \mathrm{m}$

Answer: (D)
Solution:

For a point source of power $=P$, then intensity at a point at a separation $x$ from the source is

$$
I=\frac{\text { power }}{\text { Area }}=\frac{p}{4 \pi x^{2}}
$$

$\because$ Average intensity of EM wave is given by

( $\mathrm{g}=$ gravitational acceleration)
(A) $\left[1-\left(\frac{T_{M}}{T}\right)^{2}\right] \frac{A}{M g}$
(B) $\left[1-\left(\frac{T}{T_{M}}\right)^{2}\right] \frac{A}{M g}$
(C) $\left[\left(\frac{T_{M}}{T}\right)^{2}-1\right] \frac{A}{M g}$
(D) $\left[\left(\frac{T_{M}}{T}\right)^{2}-1\right] \frac{M g}{A}$

Answer: (C)
Solution:

Initial length $=\ell$
Time period $\mathrm{T}=2 \pi \sqrt{\frac{\ell}{\mathrm{~g}}}$
After suspending mass M ,
Youngs modulus $\mathrm{Y}=\frac{\text { Stress }}{\text { Strain }}$
$=\frac{\mathrm{F}}{\Delta_{\ell}^{\ell}}=\frac{\mathrm{F} \mathrm{\ell}}{\Delta \ell \mathrm{~A}}$
Change in length of wire $\Delta \ell=\frac{\mathrm{F} \ell}{\mathrm{Ay}}$
Now Time period $\mathrm{T}_{\mathrm{M}}=2 \pi \sqrt{\frac{e+\Delta l}{\mathrm{~g}}}$
$\frac{\mathrm{T}}{\mathrm{T}_{\mathrm{M}}}=\frac{2 \pi \sqrt{\frac{\mathrm{Z}}{\mathrm{E}}}}{2 \pi \sqrt{\frac{(l+\Delta l}{\mathrm{g}}}} \quad\left[\because \frac{i}{i i}\right]$
$\frac{T^{2}}{T_{M}^{2}}=\frac{\ell}{\ell+\Delta \ell}$
$\frac{\mathrm{T}^{2}}{\mathrm{~T}_{\mathrm{M}}^{2}}=\frac{\ell}{\ell+\frac{\mathrm{F} \ell}{\mathrm{AY}}} \quad$ [putting $\Delta \ell$ value]

$$
\begin{aligned}
& \left(\frac{T}{T_{M}}\right)^{2}=\frac{1}{1+{ }_{A y}^{F}} \\
& 1+\frac{F}{A y}=\left(\frac{T_{M}}{T}\right)^{2} \\
& \frac{1}{y}=\left[\left(\frac{T_{M}}{T}\right)^{2}-1\right] \frac{A}{F} \\

Two long current carrying thin wires, both with current I, are held by insulating threads of length L and are in equilibrium as shown in the figure, with threads making an angle ' $\boldsymbol{\theta}$ ' with the vertical. If wires have mass $\boldsymbol{\lambda}$ per unit length then the value of $I$ is:
( $\mathrm{g}=$ gravitational acceleration)
(A) $2 \sqrt{\frac{\pi g L}{\mu_{0}} \tan \theta}$
(B) $\sqrt{\frac{\pi \lambda g L}{\mu_{0}} \tan \theta}$
(C) $\sin \theta \sqrt{\frac{\pi \lambda g L}{\mu_{0} \cos \theta}}$
(D) $2 \sin \theta \sqrt{\frac{\pi \lambda g L}{\mu_{0} \cos \theta}}$

Answer: (D)
Solution:

Two wires will repel each other due to current in the same direction and due to magnetic force.
$\therefore$ magnetic force per unit length is
$\frac{\mathrm{df}}{\mathrm{dl}}=\frac{\mu_{0} \mathrm{I}^{2}}{2 \pi(2 \mathrm{~L} \sin \theta)}=\frac{\mu_{0} \mathrm{I}^{2}}{4 \pi \mathrm{~L} \sin \theta}$
and mass per unit length of each $\operatorname{mix}=\frac{\mathrm{dm}}{\mathrm{dl}}=\lambda$
So, magnetic force on total length $\ell^{\prime}$ of the mix is $\mathrm{f}_{\mathrm{m}}=\frac{\mu_{0} \mathrm{I}^{2} \ell^{\prime}}{4 \pi \mathrm{~L} \sin \theta}$
and weight $=\lambda \ell^{\prime} g$

By equilibrium of mix,
$\mathrm{T} \sin \theta=\mathrm{f}_{\mathrm{m}}$ and $\mathrm{T} \cos \theta=\mathrm{mg}$
$\Rightarrow \frac{\mathrm{T} \sin \theta}{\mathrm{T} \cos \theta}=\frac{\mathrm{f}_{\mathrm{m}}}{\mathrm{mg}} \Rightarrow \mathrm{f}_{\mathrm{m}}=\mathrm{mg} \tan \theta$
$\Rightarrow \frac{\mu_{0} I^{2}}{4 \pi \mathrm{~L} \sin \theta} \ell^{\prime}=\mathrm{mg} \frac{\sin \theta}{\cos \theta}=\lambda \ell^{\prime} \mathrm{g} \frac{\sin \theta}{\cos \theta}$
$\Rightarrow \frac{\mu_{0} I^{2}}{4 \pi L \sin \theta} \ell^{\prime}=\lambda \ell^{\prime} g \frac{\sin \theta}{\cos \theta}$
$\Rightarrow \mathrm{I}^{2}=\frac{\lambda_{\mathrm{grLL}}}{\mu_{\mathrm{c}}^{\mathrm{cose}} \mathrm{e}} 4 \sin ^{2} \theta$

18. Consider a spherical shell of radius $R$ at temperature $T$. the black body radiation inside it can be considered as an ideal gas of photons with internal energy per unit volume $u=\frac{U}{V} \propto T^{4}$ and pressure $p=\frac{1}{3}\left(\frac{U}{V}\right)$. If the shell now undergoes an adiabatic expansion the relation between $T$ and $R$ is:
(A) $T \propto \frac{1}{R}$
(B) $T \propto \frac{1}{R^{3}}$
(C) $T \propto e^{-R}$
(D) $T \propto e^{-3 R}$

Answer: (A)
Solution: $\because$ in an adiabatic process.

$$
d Q=0
$$

So by first law of thermodynamics

$$
\begin{gathered}
d Q=d U+d W \\
\Rightarrow 0=d U+d W \\
\Rightarrow d W=-d U \\
\therefore d W=P d V
\end{gathered}
$$

$\Rightarrow P d V=-d U \ldots$...(i)
Given that $\frac{U}{V} \propto T^{4} \Rightarrow U=k V T^{4}$

$$
\Rightarrow d U=k d\left(V T^{4}\right)=K\left(T^{4} d V+4 T^{3} V d T\right)
$$

Also, $P=\frac{1}{3} \frac{U}{V}=\frac{1}{3} \frac{k V T^{4}}{V}=\frac{K T^{4}}{3}$
Putting these values in equation

$$
\begin{gathered}
\Rightarrow \frac{K T^{4}}{3} d V=-k\left(T^{4} d V+4 T^{3} V d T\right) \\
\Rightarrow \frac{T d V}{3}=-T d V \quad 4 V d T \\
\Rightarrow \frac{4 T}{3} d V=-4 V d T \\
\Rightarrow \frac{\frac{1}{3} d V}{V}=\frac{-d T}{T}
\end{gathered}
$$

$$
\begin{array}{r}
\Rightarrow \frac{1}{3} \ln V=-\ln T \Rightarrow \ln V \quad-3 \\
\Rightarrow V T^{3}=\text { constant } \\
\frac{4}{3} \pi R^{3} T^{3}=\text { constan } \\
R T=\text { constant } \\
\Rightarrow T \propto \frac{1}{R}

If there is a uniform magnetic field of 0.3 T in the positive z direction, in which orientations the loop would be in (i) stable equilibrium and (ii) unstable equilibrium?

## (A) (b) and (d), respectively

(B) (b) and (c), respectively
(C) (a) and (b), respectively
(D) (a) and (c), respectively

## Answer: (A)

Solution: For a magnetic dipole placed in a uniform magnetic field the torque is given by $\vec{\tau}=\vec{M} \times \vec{B}$ and potential energy $U$ is given as

$$
U=-\vec{M} \cdot \vec{B}=-M B \cos \theta

When $\vec{M}$ is in the same direction as $\vec{B}$ then $\vec{\tau}=0$ and $U$ is $\min =-\mathrm{MB}$ as $\theta=0^{\circ}$
$\Rightarrow$ Stable equilibrium is (b). and when $\vec{M}$ then $\vec{\tau}=0$ and $U$ is max $=+\mathrm{MB}$

(B) $\overrightarrow{F_{1}}$ is radially outwards and $\overrightarrow{F_{2}}=0$
(C) $\overrightarrow{F_{1}}=\overrightarrow{F_{2}}=0$
(D) $\overrightarrow{F_{1}}$ is radially inwards and $\overrightarrow{F_{2}}$ is radially outwards

(A) $\frac{\gamma+1}{2}$
(B) $\frac{\gamma-1}{2}$
(C) $\frac{3 \gamma+5}{6}$
(D) $\frac{3 \gamma-5}{6}$

Answer: (A)
Average time of collision
$t=\frac{\text { mean free path }(\lambda)}{\text { average speed }(v)}$
$t \propto \frac{\lambda}{v}$
$\because \lambda \propto \frac{1}{\text { no. of molecules per unit volume }}$
$\lambda \propto \frac{1}{\left(\frac{N}{v}\right)}$
$\Rightarrow \lambda \propto V$

And $\bar{v} \propto \sqrt{T}$
$\Rightarrow \bar{v} \propto \sqrt{\mathrm{PV}}$
$\because \mathbf{P} \propto \mathbf{V}^{-\gamma}$
for adiabatic process where $\gamma=$ adiabatic coefficient

$$

(A) $\frac{-2 G M}{3 R}$
(B) $\frac{-2 G}{R}$
(C) $\frac{-G M}{2 R}$
(D) $\frac{-G M}{R}$

$\frac{M}{\frac{4}{3} \pi R^{3}}=\frac{M^{1}}{\frac{1}{3} \pi\left(\frac{R}{2}\right)^{3}}$
$M^{\prime}=\frac{M}{8}$
Potential due to the sphere of $\frac{\mathrm{R}}{2}$ radius at its centre is

(D) $A \rightarrow i i, B \rightarrow i, C \rightarrow i v, D \rightarrow i i i$

Solution: (D) The Wacker process originally referred to the oxidation of ethylene to acetaldehyde by oxygen in water in the presence of tetrachloropalladate (II) as the catalyst.
In contact process, Platinum used to be the catalyst for this reaction, however as it is susceptible to reacting with arsenic impurities in the sulphur feedstock, vanadium (V) oxide ( $\mathrm{V}_{2} \mathrm{O}_{5}$ ) is now preferred.
In Deacon's process, the reaction takes place at about 400 to $450^{\circ} \mathrm{C}$ in the presence of a variety of catalysts, including copper chloride $\left(\mathrm{CuCl}_{2}\right)$.
In Ziegler-Natta catalyst catalyst, Homogenous catalysts usually based on complexes of $\mathrm{Ti}, \mathrm{Zr}$ or Hf used. They are usually used in combination with different organ aluminium co-catalyst.

& \left|z_{1}\right|^{2}+4\left|z_{2}\right|^{2}=4+\left|z_{1}\right|^{2}\left|z_{2}\right|^{2} \\
& \left|z_{1}\right|^{2}-4+4\left|z_{2}\right|^{2}-\left|z_{1}\right|^{2}\left|z_{2}\right|^{2}=0 \\
& \left(\left|z_{1}\right|^{2}-4\right)\left(1-\left|z_{2}\right|^{2}\right)=0 \\
& \Rightarrow \quad\left|z_{1}\right|=2 \text { or }\left|z_{2}\right|^{2}=1 \text { Given, } z_{2} \text { is not unimodular } \\
& \therefore\left|z_{1}\right|=2

& \Rightarrow a=\frac{c}{4} \\
& \qquad a=\frac{1}{2}, b=-2 \\
& \therefore f(x)=\frac{1}{2} x^{4}-2 x^{3}+2 x^{2} \\
& f(2)=8-16+8

29. The area (in sq. units) of the quadrilateral formed by the tangents at the end points of the latera recta to the ellipse $\frac{x^{2}}{9}+\frac{y^{2}}{5}=1$, is :
(A) $\frac{27}{2}$
(B) 27
(C) $\frac{27}{4}$
(D) 18

Solution: (B)

$$
\begin{gathered}
\frac{x^{2}}{9}+\frac{y^{2}}{5}=1 \\
e=\sqrt{1-\frac{5}{9}}=\frac{2}{3} \\
a^{2}=9, b^{2}=5
\end{gathered}
$$

Focii $=( \pm a e, 0)=( \pm 2,0)$
Ends of latus recta $\left( \pm a e, \pm \frac{b^{2}}{a}\right)$

$$
\left( \pm 2, \pm \frac{5}{3}\right)

Tangent at ' L ' is $\mathrm{T}=0$

$$
\frac{2 \cdot x}{9}+\frac{5}{3} \cdot \frac{y}{5}=1
$$

It cut coordinates axes at $P\left(\frac{9}{2}, 0\right) \wedge Q(0,3)$
Area of quadrilateral $P Q R S=4($ Area of triangle $O P Q)$

$$
4\left(\frac{1}{2} \cdot \frac{9}{2} \cdot 3\right)=27 \text { squareunits. }

30. If 22 identical balls are to be placed in 3 identical boxes, then the probability that one of the boxes contains exactly 3 balls is:
(A) $220\left(\frac{1}{3}\right)^{12}$
(B) $22\left(\frac{1}{3}\right)^{11}$
(C) $\frac{55}{3}\left(\frac{2}{3}\right)^{11}$
(D) $55\left(\frac{2}{3}\right)^{10}$

Answer: (C)
