  - (1) ABC (2) ACD (3) ABCD (4) BCD
- **Ans.** (1)
- Sol. In  $H_2O_2^{-1}$  oxidation state of oxygen is -1 therefore acts both as oxidising agent & reducing agent.  $H_2O_2$  is miscible in water due to intermolecular H-bonding.

 $\mathrm{H_2O_2}$  has open book structure in which both –OH groups are not in same plane

- **20.** Arrange the following compounds (assuming to be high spin) in increasing order of spin magnetic moment :
  - (1)  $(NH_4)_2[Ce(NO_3)_6] \le Eu(NO_3)_3 \le Gd(NO_3)_3$

- 21. Gallium (At. Mass = 70) crystallises in HCP lattice. If the total number of voids in 0.581 gram of gallium is  $x \times 10^{21}$  then determine 'x' :
- **Ans.** 15
- **Sol.** No. of moles of Ga =  $\frac{0.581}{70}$

No. of atoms of Ga =  $\frac{0.581}{70} \times N_A$ 

 $\therefore \text{ Total no. of voids} = \frac{0.581}{70} \times \text{N}_{\text{A}} \times 3$  $= 0.0249 \times 6 \times 10^{23}$ 

$$= 15 \times 10^{21}$$

As there are one octahedral void and two tetrahedral voids per atom.
